

Research, Restoration & Recovery The Arboretum at Flagstaff Research Department

This multi-year project is supporting surveys for two USFS Region 3 sensitive plant species within the C.C. Cragin Western Watershed Enhancement Project area, adjacent to the Mogollon Rim. Surveys will be conducted within potential habitat for Arizona sneezeweed (*Helenium arizonicum*) and Bebb willow (*Salix bebbiana*) so that forest management actions can be adequately analyzed and mitigated during project analysis and implementation. Collection of specimens for documentation of newly found sites and for collection of seed for seed banking at either The Arboretum or the Center for Plant Conservation is also being done. Photos are of *H. arizonicum*.
